North Korea's nuclear threat has stimulated international security in danger as influencing other nuclear potential countries. Despite all the strategic sanctions to demolish North Korea's nuclear ambitions, it finally became a nuclear country. If its nuclear program could be halted however, international security would be more stable towards non-proliferation.

This paper investigates the current status of North Korea's nuclear program towards weapon development, how exactly this relates to international security, and discusses a few possible steps to disrupt the process of the country's potentially dangerous nuclear attempts. Two strategic conditions between nuclear and non-nuclear country will be compared as the solution of North Korea's nuclear destination.
